

WordPress Project Task Brief

This task involves creating a fully functional WordPress website. Below are the detailed steps:

1. Install and Set Up WordPress

- Download the latest version of WordPress from the official website.
- Set up a local server using WAMP or any preferred server solution.
- Complete the installation by setting the site name, admin credentials, and URL structure.

2. Install a Theme

- Choose a suitable theme from the WordPress repository or upload a custom theme.
- Install and activate the theme through the dashboard (Appearance -> Themes).
- Customize the theme settings such as colors, fonts, and layouts based on the project's needs.

3. Install Essential Plugins

- **WooCommerce:** Install and configure WooCommerce for product management, payments, and shipping.
- **Elementor:** Install and set up Elementor for drag-and-drop page building.
- **SEO Plugin:** Install an SEO plugin like Yoast SEO for optimization.
- **Contact Form Plugin:** Install a contact form plugin like Contact Form 7 and set up a basic form.

4. Set Up Pages, Posts, and Widgets

- **Pages:** Create essential pages (Home, Shop, About, Contact) using Elementor.
- **Posts:** Set up a blog post category and create at least one sample post.
- **Widgets:** Add necessary widgets (Search, Categories, Recent Posts) to the sidebar or footer.

5. Manage User Roles

- Define roles (Admin, Editor, Author, Subscriber) and assign appropriate permissions.
- Ensure WooCommerce roles (Customer, Shop Manager) are correctly configured.

6. Final Testing and Adjustments

- Test all the functionalities like the contact form, blog posts, product pages, and user role access.
- Ensure responsiveness across devices (desktop, tablet, mobile).
- Review SEO settings and optimize meta descriptions, titles, and permalinks.
